

Before you start: close NukeStudio, Hiero and Nuke. If they are open they lock the files, and the installation may fail or be left halfway through.

Automatic installation

Extract the whole `.zip` into any folder. The installer and the `Startup` folder have to stay together.

Windows

- Double-click `installer_win.bat`.

macOS

- Open Terminal in the folder where you extracted the `.zip`.
- Run:

```
bash installer_mac.sh
```

- The leading `bash` is deliberate: `.sh` files lose their executable permission while travelling inside the `.zip`, so `./installer_mac.sh` would fail with *Permission denied*.

What the installer does

HieroTools is not a Nuke plugin: it **does not touch** `init.py`. It installs three separate items inside `~/ .nuke/python/startup/` (on Windows, `%USERPROFILE%\ .nuke\python\startup`):

- `LGA_HieroTools_Startup.py` — the startup script.
- `LGA_HieroTools/` — the folder holding the tools.
- `LGA_HieroTools_context.ini` — the configuration.

If a previous installation was found, it backs up the first two as `LGA_HieroTools_Startup.py.bak` and `LGA_HieroTools_backup`.

The `context.ini` is the exception: it is **always overwritten and never backed up**, because the working mode is set by the `.zip` you are installing, not by the previous installation.

Manual installation

If you would rather do it by hand, or the installer fails, copy the three items from the `Startup` folder into `~/ .nuke/python/startup/`. There is no line to add to `init.py`.
